

F1 Switching the spatial graph off. Error metric, lower is better; bars show the change from removing the graph.

Paired by seed against the learned-gate model, 5 seeds, same rule as the committed gate_ablation.log: within noise when the absolute mean is below its own across-seed sd. Left bar RMSE, right bar MAE.
Over the 40 error cells the graph helps 0 and removing it wins 8 (all green), the rest are noise. The graph earns its keep on correlation only, not on error. Single-disease checkpoints (results/single/); dengue uses its country-macro.
