

F4 Lookback window sensitivity. RMSE, lower is better; the base model uses lookback 20 (black).

Absolute RMSE, 5-seed mean, error bars the across-seed sd. The released base model uses a 20-week lookback (black). A shorter window helps a little on us-states and japan at long horizons, a longer window clearly hurts on COVID; on paired within-noise tests most cells are indistinguishable from base. Dengue was not run for this sweep and is absent by design.
